Subject: Re: openeo-argoworkflows debugging

Hi Juraj!

If you take a look at the config below, I have only updated the oidcUrl, and on redeployment, it should be reflected in the issuer. If it still is not, this may be because the config map has not updated correctly, so try a redeploy again, and remove the extra values you have defined oidcClientId & oidcClientSecret, these are not necessary. A quick note on why, the api doesn't operate as an oidc client, all it does is verify provided tokens against the provider to and grant users access. In the context of openeo, the web-editor would be a client, as it has login, logout, and the ability to redirect.

Let me know if the issue persists, and maybe we can take another look together.

```
global:
  env:
    alembicDir: "/opt/openeo_argoworkflows_api/psql"
    apiDns: 127.0.0.1:8000
    apiTLS: false
    apiTitle: "OpenEO ArgoWorkflows"
    apiDescription: "A K8S deployment of the openeo api for argoworkflows."
    oidcUrl: "https://edp-portal.eurac.edu/auth/realms/edp"
    oidcOrganisation: "keycloak"
    oidcPolicies: ""
    stacCatalogueUrl: "https://stac.eodc.eu/api/v1"
    workspaceRoot: "/user_workspaces"
    executorImage: "ghcr.io/eodcgmbh/openeo-argoworkflows:executor-2025.5.1"
    daskWorkerCores: "4"
    daskWorkerMemory: "8"
    daskWorkerLimit: "6"
    daskClusterTimeout: "3600"
```

PS. Note in the endpoint there is no way to currently update the title, I will do a small update in the fastapi to make this easier to replace.

Best,
Sean

Hi Sean,

I hope you are doing well. So we are sort of struggling with reusing our internal Keycloak in the configuration. We have changed the OIDC URLs and configs related to that but our openeo-argoworkflows still points to EGI and we are not sure where it is coming from.

Our deployment still shows this: <https://openeo-eurac.develop.eoepca.org/openeo/1.1.0/credentials/oidc>

However, within our manifest you can see that the values have been updated:

global:

```
env:
  alembicDir: /opt/openeo_argoworkflows_api/psql
  apiDescription: A K8S deployment of the openeo api for argoworkflows.
  apiDns: openeo-eurac.develop.eoepca.org
  apiTLS: true
  apiTitle: OpenEO ArgoWorkflows
  daskClusterTimeout: '3600'
  daskWorkerCores: '4'
  daskWorkerLimit: '6'
  daskWorkerMemory: '8'
```

executorImage: ghcr.io/eodcgmbh/openeo-argoworkflows:executor-2025.5.1
odicOrganisation: eurac
oidcClientId: openEO
oidcClientSecret: 8f7f2fb0-4347-44be-b5be-d752cbd3de11
oidcPolicies: "
oidcUrl: https://edp-portal.eurac.edu/auth/realms/edp
stacCatalogueUrl: https://stac.eodc.eu/api/v1
workspaceRoot: /user_workspaces

Do you know why this is the case? Is there some place else we need to reconfigure? Based on what we can see this thing above is the main entry for configurations correct? If you need any more details, I am happy to provide them. Thank you very much and have a nice day!

Cheers,
Juraj

Hi Sean,

Thank you very much for the update. Great that it works on your end. We are still looking into it trying to understand the whole setup better. I will get back to you if we have any problems or questions! Have a nice day!

Best,
Juraj

Hi again,

Just to confirm, that should work. We resolved the issue on our side and I am able to use tokens from keycloak to query the openeo api 😊 Let me know if you have any trouble!

Best,
Sean

Hi Juraj,

Sorry for the late reply, I have been trying to use the eodc keycloak instance to test the config for a keycloak backed openeo-argoworkflows. I am sure this previously worked, but currently I can't seem to get it to because of issues with our keycloak. Do you have a method for generating tokens from your keycloak? Given a bearer token, you should be able to set the oidcUrl to the corresponding realm (at eodc the example would be <https://bouncer.eodc.eu/auth/realms/EODC/>) and odicOrganisation (need to fix this typo in the chart) to keycloak.

Get a token from keycloak, and try to access /me in the openeo api deployment with the above config, Auth headers to the openeo about need to look like "Bearer /odic/keycloak/{keycloak token}". That *should* work. I will continue to test on my side when I get a response from IT, for some reason I'm unable to query the userinfo endpoint.

Best,
Sean Hoyal

Hi Sean,

So, EOEPKA uses Keycloak as far as I know for most services so maybe that could be nice to integrate so that we can use the test users for openeo auth easily. I personally like EGI check-in but yea I am not sure how the access to that works and what the costs are etc.

If I understand correctly what you mean is that we add Keycloak implementation for example here? https://github.com/eodcgmbh/openeo-argoworkflows/blob/main/openeo_argoworkflows/api/openeo_argoworkflows_api/auth.py

Thank you!

Best,
Juraj

Hi Juraj,

Great to hear you found success. I expect it currently wouldn't work changing, the intention was the have a flexible auth implementation, but honestly I do not remember if I tested it with Keycloak or not. It's likely the case that we just extend the implementation in the api. Do you know what provider you

would want to use, Keycloak, Github, or another? I wouldn't expect it's so much work to extend this part of the api.

Best,
Sean

Hi Sean,

so good news, we managed to run the backend on the argocd cluster. The changes to the redis/postgres were not applying properly so they had to be manually deleted and recreated. Sync itself did not handle this.

I have maybe one question The implementation uses EGI check-in. This is not really open source, is it? Are we allowed to use it if we are using your deploying?

From their website: "EGI Operations, as owner of the Check-in service, must approve every request for integration of new services with Check-in."
<https://docs.egi.eu/providers/check-in/sp/>

I suppose we need to address this somehow if we want to reuse it. Would this require a crazy amount of work to change the auth system? I assume yes haha. Thank you very much!

Best,
Juraj
